Laboratory Exercises for Signals and Systems II

The laboratory exercises will help you in understanding and practically employing the content presented in the lectures. By default, you will work on the assigned tasks in teams of three students. Successful participation entitles you to take the exam at the end of the semester. You will successfully participate if

1. you attend all four sessions
   Attendance is mandatory unless you feel sick. In that case, avoid infecting others by staying home. If you feel like it, you can participate online via MS Teams. To support you in taking responsibility, I will require you to provide a doctor's sick note only if you are missing *more than one* session.
2. you have been responsible for your team's solutions for at least one of the four sessions and
3. your team has presented acceptable solutions for all four sessions.

There are two alternative ways to present your team's solution:

a) Submitting your results to bjoerningo.lange@haw-hamburg.de at latest one week after your laboratory session. Your email should include
   1. the MATLAB .mlx-files containing your code (scripts and functions, fully functional; sufficiently commented) and
   2. a supplementary .pdf-file with a short summary of your results (graphical output and answers to the questions from the assignment sheet)

   or

b) Presenting and explaining your solution to me at the laboratory session.

It is preferable for you to opt for b) because:

- It will save your (and my) time.
- Personally presenting your solution will support and deepen your understanding.
- In the conversation that develops from your presentation, we can discuss your individual questions / topics that are of special interest to you.

Good preparation for the laboratory sessions is needed for finishing and presenting your solution during the session. Prepare by reading and understanding the instructions, consult the MATLAB documentation and review the provided sample programs to learn how the proposed MATLAB functions are employed. Please also note the sample programs from the lecture provided to you via Moodle.

I am looking forward to working with you in the laboratory sessions!
